

Field trip to Vila do Bispo and Sagres

One of the main goals of the LIFE Charcos project (<http://lifecharcos.lpn.pt/en/>) is the conservation and restoration of Mediterranean Temporary Ponds in the area of project intervention, which overlaps the Parque Natural do Sudoeste Alentejano e Costa Vicentina (PNSACV), the southwestern region of Portugal.

In the Vila do Bispo county and Sagres region, we can find some well preserved temporary ponds, and also some that were submitted to restoration. Our visit to this region aims to show some of the project interventions.

During the visit we will also be able to observe flora and fauna characteristic from these fragile freshwater systems, and also experience some of the most beautiful landscape in Portugal. We will have walking trips and time for picnic.
